## **New whitepaper: How to make threat actors work harder and fail more often**

Offensive cyber operations, or Red Teaming as it is known when delivered commercially, can help organisations to assess their defensive security posture against the attack techniques used by real-world hackers.

More often than not, the attacker wins because of poor security hygiene inside and outside of the defending organisation.

With this in mind, we've published a new whitepaper from our global CTO, Ollie Whitehouse, to help organisations build their cyber resilience.

Thematic for success in real-world offensive cyber operations – How to make threat actors work harder and fail more often is based on the techniques that our Red Team use to breach organisations across the globe.

At each stage of an attack, we focus on the areas and mitigations that force our operatives to take more risks and be less effective, so that you can prioritise these areas and thwart real-world attacks more efficiently in your own organisation.

You can download the paper [here](#).

For more information on building your organisation's resilience, visit our [Insight Space](#) or get in touch today.
